

Hi, my name is Smart Herb Garden.  
Let's get to know each other!

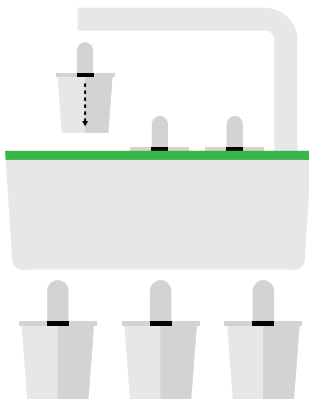

### 1. PREPARE THE CARTRIDGES

Open the cartridge boxes and carefully pull off the green stickers. Be sure to leave my U-shaped white lids on!

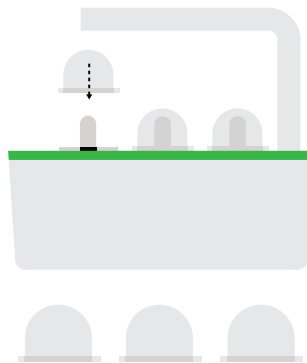

### 2. NAME MY PLANTS

Give each plant their unique name, so that you'll remember whether they'll grow up to be Basil, Thyme or Lemon Balm. Be creative!

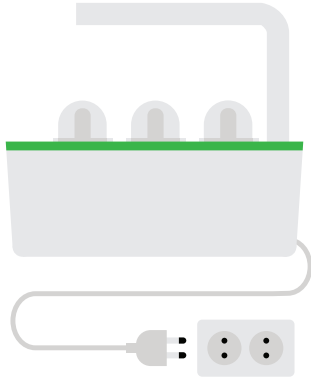

### 3. INSTALL THE CARTRIDGES

Place all cartridges in the slots provided and press until you feel or hear a slight click.

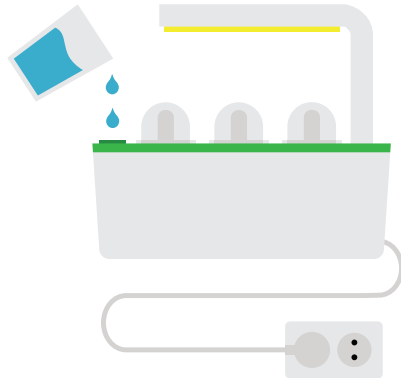

### 4. COVER THE PLANTS

All of my cartridges come with a transparent dome to create a mini-greenhouse effect. Each sprout must be covered until it starts to reach the dome.

## 5. PLUG ME IN

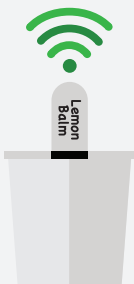

Connect my power cord in the morning around 8 AM, this will start my daily lighting cycle (approximately 16h day / 8h dim night). My lamp will light up and start blinking, indicating that my watertank is empty.

## 6. FILL THE TANK

See the water pit on the opposite end of the lamp? Fill it with water until the floater inside the pit is perfectly aligned with the top of the surface. Please do not overwater me! I can hold 5 cups / 1.3 L / 44 oz of water. The lamp stops blinking once there is enough water.

## And then?

Register me at [clickandgrow.com/activate](https://clickandgrow.com/activate) to get great tips and tricks on how to keep me ever-happy.

First sprouts appear in 2-3 weeks.

Full plants appear in 2-4 months and are enjoyable for 4-8 months.

# Here are some tips on how to become a smart gardener and my best friend.

## **Remember to remove the domes when my sprouts start to reach them**

Place the domes as soon as you have started to grow plants. I recommend leaving the domes on until my plants start to reach them. My white, round-shaped plastic lids should not be taken off at all.

## **You can change my grow light timer as you wish**

My timer schedule works approximately 16 hours on and 8 hours off. Every time you plug me into the power socket it will start my schedule from the beginning. For example, if you plug me in at 8 AM, I will turn myself off around 12 AM and then on again around 8 AM. During my off hours the lamp is on a dim mode.

## **The lamp starts blinking when my plants get thirsty**

I was built smart, so I will let you know when to water me by blinking my light. Water me until the light stops flashing and make sure my floater is exactly even with the surface and not higher than the surface.

## **I have an adjustable lamp**

My lamp arm has 3 different positions. In the beginning, put the lamp at the lowest position, and then lift it according to my plants' growth. Lamp's position is fixed when you feel or hear a slight click.

## **You can expect sprouts to appear in 1-3 weeks**

Different plants grow at different rates, so some of them will sprout within a week, while for others it may take up to 3 weeks. This depends on the natural sunlight provided and room temperature.

## **Enjoy my herbs when they start to reach the light**

This is the moment we have both been waiting for, and now you can enjoy your own homegrown herbs. You may use my plants day by day or start to use them when they have grown bigger. Be creative and get the most out of the freshness at your fingertips.

## **Trim my plants if they start to reach the light**

My plants tend to grow by height, not width. Cutting them can make them yield more and live longer. Cut the plant with a sharp knife or scissors near a branch. The remaining part should have at least 2-4 pairs of leaves. Two new shoots will soon appear and the process can be repeated.

## **I come with a full warranty**

If you happen to notice any manufacturing defects, Click and Grow will happily exchange me for a new unit during the first 12 months from purchase.

## **Special warning**

The blinking light indicates an empty tank, but it can be a visual stimulus that may cause seizures in people with photosensitive epilepsy.
